

The World's Billionaires

Benjamin D. Hennig and **Danny Dorling** map the contours of the world's plutocracy.

In spring 2012, *Forbes Magazine* reported that there were 1153 billionaires across the globe (this figure includes families, but excludes fortunes dispersed across large families where the average wealth per person is below a billion). The total wealth of the billionaires was US\$3.7 trillion – as great as the annual gross domestic product of Germany. Top of this league table is the US* with 424 billionaires (or billionaire families), followed by Russia (96) and China (95).

Looking at data collected by *WealthInsight* – which published more detailed statistics on the geographic distribution of 521 of the wealthiest billionaires – we can see that the plutocrats' global city of choice is Moscow with 78 billionaire residents, followed by New York City (58), Hong Kong (40), and London (39).

The most attractive place for foreign wealth appears to be the United Kingdom with 15 different nationalities represented in the richest of the rich there. This tops even Switzerland (14 nationalities) and the United States (9).

Much of the wealth of billionaires is held offshore and their wealth is the tip of an iceberg of hard-to-tax personal assets. In a recent *Tax Justice Network* report, James Henry estimated the overall global offshore financial assets held by the world's richest to be between US\$21 trillion and US\$32 trillion (out of the total global wealth, estimated at US\$231 trillion). Nearly half of these offshore assets are owned by the world's richest 91,000, just 0.001 per cent of the global population.

The distribution of this wealth is a story of extreme inequality. For each billionaire there are millions of people who can only ever dream of such wealth – the ratio is only slightly smaller in the richest countries of the world: in the USA one billionaire can be found for every 740,000 people, while in India one billionaire is found amongst every 26 million people.

Over time the inequalities in the distribution of global wealth have become ever more polarised. According to data by the United Nations University (UNU-WIDER) in 2009 half of all global household wealth was

owned by the richest 2 per cent of adults. The poorer half of the world's population owned just 1 per cent of the global wealth between all of them. Their distribution is the reverse image of the wealth maps shown here.

But it is not only wealth inequality that becomes very apparent in these numbers. The gender gap is large among the rich: Of the countries with more than 10 billionaires, Sweden is the most equal. But even here only 27 per cent of billionaires are female, followed by Germany (20 per cent) and Brazil (19 per cent). Russia, home to the second largest number of billionaires, only has one woman in the ranking, and the USA is not much better with only 10 per cent of the country's billionaires female. Thirty-seven of the 59 countries shown here have no female billionaires at all.

*Alaska looks very large in this map because it is transformed in one piece with the rest of the USA. It is more likely to be much smaller in terms of its share of the billionaires within the country. **Countries shaded the same colours in top and bottom left world maps to allow comparison.
